SAFETY SUMMARY

FOLLOW EXACT OPERATING PROCEDURES
Any deviation from the procedures described in this User’s Manual may create one or more safety hazards, may damage the WRM-10, damage the test transformer, or cause errors in the test results. Vanguard Instruments Company, Inc. assumes no liability for unsafe or improper use of the WRM-10.

All safety precautions provided in this manual must be observed during all phases of testing including test preparation, test lead connection, actual testing, and test lead disconnection.

SAFETY WARNING AND CAUTIONS
The WRM-10 shall be used only by trained operators. All transformers under test shall be offline and fully isolated.

DO NOT MODIFY TEST EQUIPMENT
To avoid the risk of introducing additional or unknown hazards, do not install substitute parts or perform any unauthorized modification to any WRM-10 test unit. To ensure that all designed safety features are maintained, it is highly recommended that repairs be performed only by Vanguard Instruments Company factory personnel or by an authorized repair service provider. Unauthorized modifications can cause safety hazards and will void the manufacturer’s warranty.

WARNING
Do not remove test leads during a test. Failure to heed this warning can result in lethal electrical shock to personnel and damage to the equipment.

</table>
1.0 INTRODUCTION

1.1 General Description and Features

The WRM-10 is designed to accurately measure the winding resistance of highly inductive power transformers. The unit’s dual resistance-reading input channels can measure two winding resistances simultaneously. Four-wire (Kelvin) connections provide high accuracy voltage reading and require no lead compensation. The WRM-10 provides stable resistance readings of very large transformers by utilizing a 36 Vdc power supply capable of outputting up to 10 Amperes. The resistance reading of a 100MVA transformer can be achieved in 5 minutes or less. The unit’s power supply is cooled by heavy-duty fans designed for continuous operation.

Since the WRM-10 can accurately measure resistances ranging from 1 micro-ohm to 2,000 ohms, it can also be used to measure EHV circuit-breaker contact resistance, motor winding resistance, or any low resistance. In addition to measuring the resistance value, the WRM-10 also checks the “make-before-break” tap-switching sequences of voltage regulators and load tap changers.

The WRM-10 is furnished with three 50-foot test cables, a ground cable, a power cord, and a cable carrying bag. Each test cable lead is terminated with a quick-disconnect test clip.

1.2 Functional Description

The WRM-10’s operation is based on the electrical relationship described by Ohm’s law: \( R = \frac{V}{I} \), where \( I \) is a known current and \( V \) is the DC voltage measured across the unknown resistance. The value of the unknown resistance is calculated by dividing the measured voltage by the current which is calculated by the microprocessor. Calculated resistance readings are then displayed on the unit’s back-lit LCD screen.

A special current source allows the WRM-10 to output up to 10 Amperes of test current. The test current is automatically adjusted depending on the load resistance. For added safety, the current source circuit is thermally protected. Also, a built-in discharge circuit automatically discharges the stored energy in the transformer at the end of each test.
## Technical Specifications

### Table 1. WRM-10 Technical Specifications

**NOTE**

The above specifications are valid at nominal operating voltage and at a temperature of 25°C (77°F). Specifications may change without prior notice.
1.4 WRM-10 Controls and Indicators

The WRM-10’s controls and indicators are shown in Figure 1 below. A leader line with an index number points to each control and indicator, which is cross-referenced to a functional description in Table 2. The table describes the function of each item on the control panel. The purpose of the controls and indicators may seem obvious, but users should become familiar with them before using the WRM-10. Accidental misuse of the controls will usually cause no serious harm. Users should also be familiar with the safety summary found on the front page of this User’s Manual.

2.0 PRE-TEST SETUP

2.1 Operating Voltages

The WRM-10’s operating voltage is preset at the factory and is selectable between 100-120 Vac, 50/60 Hz or 200-240 Vac, 50/60 Hz. The voltage is set by placing jumper(s) on the power terminal block as listed in Table 3 and illustrated in Figure 2 and Figure 3. The relay must also be changed if the voltage settings are changed. Please see Figure 4 for the location of the relay.

</tbody>
</table>

Figure 2. 100 – 120 Vac Jumper Settings

Figure 3. 200 – 240 Vac Jumper Settings
Figure 4. Relay Location

NOTE: If the voltage settings are changed, the relay must also be changed.
2.2 LCD Screen Contrast Control

To adjust the LCD screen’s contrast:

a. Start from the “MAIN MENU”:

```
MAIN MENU
<RUN TEST>
```

Turn the [CONTROL KNOB] till the following screen is displayed:

```
MAIN MENU
<ADJ CONTRAST>
```

Press the [CONTROL KNOB].

b. The following screen will be displayed:

```
ADJ CONTRAST
"PUSH" = DONE
```

Turn the [CONTROL KNOB] clockwise to increase the contrast (darken the screen).

Turn the [CONTROL KNOB] counter-clockwise to decrease the contrast (lighten the screen).

Press the [CONTROL KNOB] when you are done adjusting the contrast level. You will be returned to the “MAIN MENU”.
3.0 OPERATING PROCEDURES

3.1 WRM-10 Cable Connections

Typical WRM-10 connections diagrams are shown in Figure 5 and Figure 6. A typical dual winding connections diagram is shown in Figure 7.

**WARNING**

Do not touch or disconnect any test lead that is connected to a transformer terminal while high current is being conducted during a test. Failure to heed this warning can result in lethal electric shock to personnel and/or damage to the equipment.

**WARNING**

Disconnect the test clips from the transformer bushing only after the WRM-10 has completely discharged the transformer. Always disconnect the test clips slowly from the transformer bushing to prevent an accidental flash-over.
NOTE

The above figure illustrates the simultaneous testing of both the high and low windings on a single-phase transformer. When measuring two channels, the above cable connection is recommended since it will speed up the testing process.
3.2 General Procedures

The main steps for using the WRM-10 are outlined below:

a. Ground the WRM-10 to the substation ground.

   **WARNING**
   Always connect the WRM-10 to the substation ground before connecting any test lead to any transformer bushing. Failure to follow this procedure may damage the WRM-10.

b. Plug the WRM-10 power cable into a power outlet.

c. Insert current-cable plugs and voltage-sensing cable plugs into the corresponding control panel jacks.

d. Attach the test cable clamps to the transformer terminal for the winding that is to be measured.

e. Turn on the WRM-10 by pressing [I] on the power rocker switch.

f. The unit will self-calibrate, and then you will be presented with the “MAIN MENU” as shown below:

   ![MAIN MENU](image)

   <RUN TEST>
3.3 Performing Transformer Tests

3.3.1. Performing a Single Resistance Test

a. Start from the “MAIN MENU”:

```
MAIN MENU
<RUN TEST>
```

Press the [CONTROL KNOB].

b. The following screen will be displayed:

```
RUN TEST
<V1 & V2>
```

Turn the [CONTROL KNOB] till the following screen is displayed:

```
RUN TEST
<V1 ONLY>
```

Press the [CONTROL KNOB].

c. The following screen will be displayed:

```
FLASH-OVER IF
cABLES REMOVED!
```

Press the [CONTROL KNOB].

d. The following screen will be displayed:

```
“PRESS” TO START
“TURN” TO ABORT
```

Press the [CONTROL KNOB] to start the test. You can abort the test by turning the [CONTROL KNOB].

e. The following screen will be displayed:

```
XFMR CHARGING
```

The above screen will continue to display while the WRM-10 is performing the test (the lightning bolts will be flashing). When the WRM-10 has determined that the resistance readings are stable, the test results will be displayed as shown:

```
R1 = 10.0 mΩ
R2 = 10.5 mΩ
```
The WRM-10 will continue to apply the test voltage on the transformer’s windings and update the resistance values on the LCD screen. Press the **[CONTROL KNOB]** to stop the test.

f. The WRM-10 will automatically discharge the transformer and display the following screen during the discharging process:

![DISCHARGE XFMR! PLEASE WAIT...](image)

After the transformer is discharged, the test results will be displayed on the screen as shown:

![Results](image)

R1 = 10.0 mΩ
R2 = 10.5 mΩ

Press the **[CONTROL KNOB]**. You will be returned to the “MAIN MENU”.
3.3.2. Performing a Voltage Regulator Test

The Voltage Regulator Test verifies that a regulating switch in a primary voltage tap regulator changes contacts through its selection range without a break in the circuit. This test is important because in actual use, any break in the current in a regulating tap switch generates large reactive voltage spikes that are hazardous and may exceed the switch’s voltage ratings, thus causing irreparable damage. By connecting the WRM-10’s continuity test input across the switching input and running the regulator switch through all the contacts in its range, any break in continuity caused by faulty tap switching can be detected.

To perform a voltage regulator test:

a. Start from the “MAIN MENU”:

   ![Main Menu Screen]

   Press the [CONTROL KNOB].

b. The following screen will be displayed:

   ![Run Test Screen]

   Turn the [CONTROL KNOB] till the following screen is displayed:

   ![Run Test Screen]

   Press the [CONTROL KNOB].

c. The following screen will be displayed:

   ![Flash-Over Warning]

   Press the [CONTROL KNOB].

d. The following screen will be displayed:

   ![Voltage Reg Test Screen]

   Press the [CONTROL KNOB] to start the test.
e. The following screen will be displayed while the test is being performed:

* XFMR CHARGING *

After the transformer has been charged, the following screen will be displayed:

V REG. TEST
RUN TAPS NOW

Run the voltage regulator tap switch.

f. If no transient is detected as the taps are switching:

1. The screen display will not change
2. Turn or press the [CONTROL KNOB] to end the test. The following screen will be displayed:

NO TRANSIENT
DETECTED

If a switch break is detected:

1. The following message will be displayed:

TRANSIENT
DETECTED

2. Turn or press the [CONTROL KNOB] to end the test.
3.4 User Diagnostic Mode

The user diagnostic mode can be used to monitor the V1 and V2 voltages and the test current on the WRM-10’s LCD screen. To use the WRM-10 in user diagnostic mode:

a. Connect the WRM-10 to the test transformer, and then start from the “MAIN MENU”:

```
MAIN MENU
<RUN TEST>
```

Turn the [CONTROL KNOB] till the following screen is displayed:

```
MAIN MENU
<USER DIAG>
```

Press the [CONTROL KNOB].

b. The following screen will be displayed:

```
RUN TEST
<V1 & V2>
```

Turn the [CONTROL KNOB] till the following screen is displayed:

```
FLASH-OVER IF
CABLES REMOVED!
```

Press the [CONTROL KNOB].

c. The following screen will be displayed:

```
“PRESS” TO START
“TURN” TO ABORT
```

Press the [CONTROL KNOB] to start the test.

d. The following screen will be displayed momentarily:

```
CALIBRATING
PLEASE WAIT...
```

The WRM-10 will then alternate between displaying the following screens:

```
V1 = 1.03V
I = 00.005A
```

```
V2 = 1.03V
I = 00.005A
```

e. Press or turn the [CONTROL KNOB] to end the test. You will be returned to the “MAIN MENU”.
